MySQL Container 'e-commerce' connection in dbeaver

Scenario 1: Successful transaction

The screenshot shows the DBeaver interface with the 'e-commerce' database selected. The SQL Editor displays a script to save a transaction, check results, and show a calculated total. The Results pane shows the output of the queries.

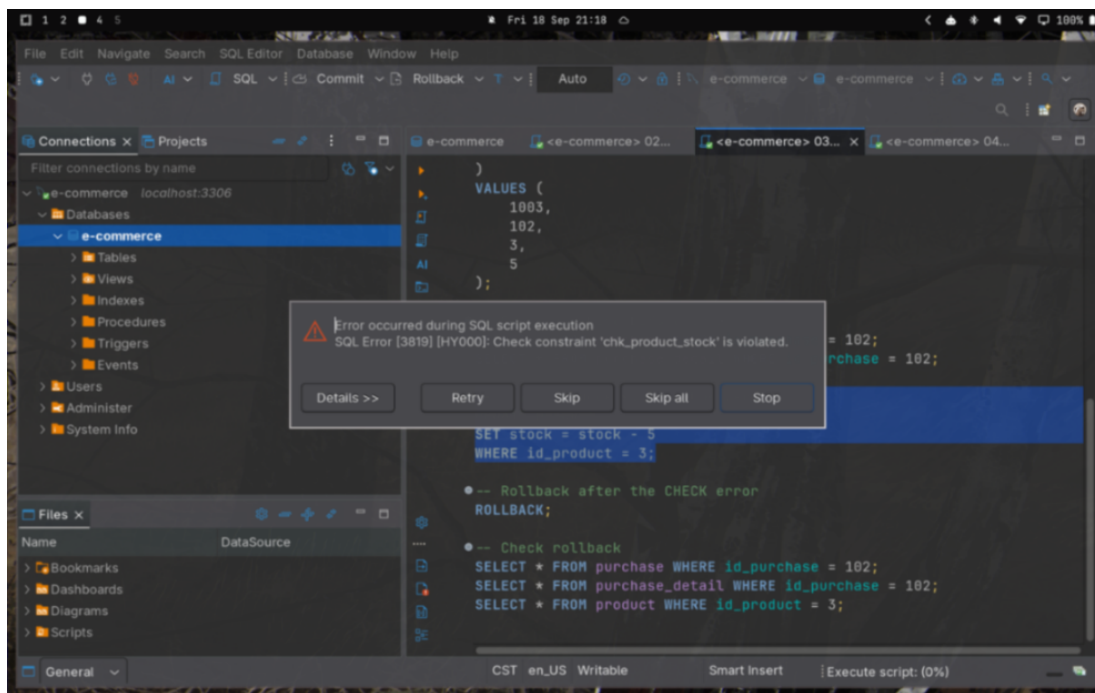

```
-- Save transaction
COMMIT;

-- Check result
SELECT * FROM purchase WHERE id_purchase = 101;
SELECT * FROM purchase_detail WHERE id_purchase = 101;
SELECT * FROM payment WHERE id_purchase = 101;
SELECT * FROM product WHERE id_product IN (1, 2);

-- Show calculated total
SELECT @purchase_total AS purchase_total;
```

purchase_total
2,000

Scenario 2: Stock violation

Scenario 3: Invalid Payment
